

Blog 3: Weather API Working

Introduction

Weather APIs provide real-time data collected from weather stations and satellites. They help applications display current weather conditions.

Concept

The API gathers environmental data such as temperature, humidity, and pressure and makes it available for developers.

Working

User enters city → request sent → API processes → data returned in JSON → displayed on screen.

Applications

Used in weather apps, smart devices, and navigation systems.

Future Scope

Future APIs will provide more accurate predictions using AI and machine learning.
